

TEST2-8 Evidence Review

Overall outcome: Unverified **QA status:** Evidence Reviewed

The supplied screenshots directly support the initial GIS workspace and visible map controls. The remaining criteria are inconclusive because the evidence does not directly demonstrate selected-layer rendering, panel-close persistence, zoom retention after another map tool, or default-view restoration.

Criterion outcomes

#	Criterion	Outcome	Evidence assessment
1	Open the GIS workspace; the map controls remain visible.	Passed	01-initial.png shows the GIS workspace with visible map controls.
2	Open the layer panel and select a coverage layer; the selected coverage layer is visible.	Unverified	02-coverage-layer.png shows the Predicted Coverage entry, but not decisive selected-layer rendering in the map.
3	Close the layer panel; the selected coverage layer remains visible.	Unverified	03-panel-closed.png does not prove that a selected coverage layer remains visible after closing the panel.
4	Use another map tool after changing the zoom position; the zoom position is retained.	Unverified	No decisive before-and-after evidence demonstrates zoom retention after switching tools.
5	Return to the default view; the expected starting area is restored without hiding the map controls.	Unverified	04-map-context.png shows the launcher overlay and map, but does not prove default-view restoration.
